

# Rate of dam and ditch Ag. production

With the last of the rivers made flowing likely to be determined by flow rate, sedimentation rate of reservoir filling mud and the life expectancy of the water control structure. So we'd have a few small flow river/creeks at the top of watersheds and rocky island rivers deftly dammed. It's best not to undam all the rivers, likely retaining 1% to 3% of dam and ditch Ag., it grows food. While not completely losing the art of it and the tools to do it, have the ability to quickly double dam and ditch Ag. to say 2% to 6%. so as to be better able to deal with any fruit and nut tree related disease as it relates to overall food production. And this 16 year idea to largely reengineer civilization comes with a 4 year grace period, for legal purpose, flexibility.

# Rate of dam and ditch agriculture reduction.

Considering all of the factors I recommend near 30% fluidification first year, a bit more than 10% dams made flowing second year, less than 10% the third year... At year 8 target 50% reduction in dam and ditch Ag. This is based on 8 years for fruit trees to start producing fruit. Humans losing  $\frac{1}{2}$  the dam food in processing and another  $\frac{1}{4}$  in the trash. Note rain fall irrigated and pump irrigation not affected but by increase in fossil fuel price increase pumping costs. By reducing the amount of food lost in processing and thrown in the trash couple with increase in kitchen garden, structural honey and animal food production should have plenty to eat. Eat your dog or cat, get geese.

Let's say at 16 years fruit and nut production is high and we've reduced dam and ditch Ag. to 1% - 3% total flow. Plenty of food to eat. With the remaining bit of dam and ditch Ag. split  $\frac{1}{2}$  "organic",  $\frac{1}{2}$  fossil fuel powered. This creates tourism possibilities where for instance you could go on a vacation from the flowing river world back to the "damages". With the possibility of an "Amish/Quaker/Mennonite land" where they're actually realistically maintaining the using of animals for power and the skills, knowledge of, and the tools to do it. Some of these areas may even have the collective productive structures. With the fossil fuel powered  $\frac{1}{2}$  of the dam and ditch Ag. left we'd continue making a small fraction of the fossil fuel derived fertilizers and pesticides. Not completely stop doing the damn stuff, at least in the immediate future, it is a resilient system. With the fossil fuel reduction rate similar to the dammed river made fluid rate. With the fossil fuel reduction the main idea is to lessen the amount of rock stacking, ditch digging, shed maintenance and flush fail in general. When viewed like an airplane landing we want the fossil fuel reduction rate to appear like a very short soft field with no landing. Eventually getting the rate of fossil fuel being burned or used to match its natural production. On this planet's surface with the way things are and what's been written, the team I, John Lawrence Kanazawa Jolley, present including Anthony

Michael Davanzo (looks like Emanuel) and University of Florida Doctor of Wildflowers Hector Perez, we, along with President Donald John Trump (and I assume he would bring at least a 1/3 of our team with us to any table we go) may be able to easily make the presentation that's needed. Let's imagine it's the 21<sup>st</sup> of January, 2025, noon Riverday, tomorrow's Tuesday and night. We've already had the Canadians, Brazilians, Mexicans, Cubans... crack open and start making fluid the Shark River dam in Florida, the lower Rio Grande Presa, the lower Colorado River dam, the bottom Columbia River dam, dam #27 on the Mississippi River, the first dam coming up the Hudson River.. And we've reciprocated, punching holes in nations water control structures on rivers. Checks in the mail, electronic funds have been transferred for the work accomplished or we're writing the paper up now to be signed... We've established what we are doing, dam fluidification for money. Flooding's not that bad, wildflower seeds are being planted... Where are we going with the ideas presentation? Should be pretty simple, have Mr. Davanzo, Sec. of State/Ambassador to the U.N. trade electronic signatures with King Saud, Davanzo's signature to be copied on paper and rubber cemented to the blank canvas back side of the \$500,000,000 Dali

crucifixion painting. Saudi's signature is he agreeing to reduce sweet crude output with our security presented. Note King Saud might offer to sell the endorsed Dali to the Israelis, see if he can get the Jews to buy it, or sell it to the Iranians first. With a deal to reduce sweet crude extraction see to get the President of Venezuela to do the same with the sour oil. More money to make for longer with the idea. Having used the event of initiating undamming the world's rivers and correct skinsuit presentation as the lever to "lock the black stuff in the ground" - bible, use the reduced amount / more expensive liquid fossil fuel as a reward or "carrot" to get nations to burn less coal. With the President Donald John Trump, Dr. Wildflowers Pérez led new cabinet position it may be best to have former Sec. of State Blinken for perhaps Don knows of a better cut fellow say named Ryan Blitzen, be Lt. Sec. of State and head for Helsinki, to see about getting the Finns to start trading down fluidification "assaults" with the Russians... As for as the nuclear thing goes, go out to the most dangerous weapon in the world cornfields where the genetically engineered to kill the men-of-T (thinking, reasonable, conscious males in particular) food is grown, pick out the most in need of repair nuclear missile silo hidden underneath the corn and start disabling the thing with the idea to use the warhead material as fuel on a nuclear powered spaceship. And wed initially design the ships to transport nuclear waste material off

the surface. Now at noon on Riverday Jan. 21, 2025, President Donald John Trump, Dr. of wildflowers Pérez (Latin American, Cuban American, oriental Portuguese, of the most enterprising of all the world's people genetic carrier) and I, should be in Okinawa, historically the center of negotiation for the Pacific. What I bring to the table is the answer to the question posed in the Japanese legend or what amounts to the most refined version of the Asian versions of the bible. I match the description of the lead character, able to walk the concrete tightrope strung out over crystal clear pure water on one side, festering sewage on the other, hoops of fire smoke, mirrors, pitfalls, dragons... He's been married to a Japanese female, Misa Kanazawa, writes letters to his former wife's sister, Yucca Kanazawa. "Appears in the East like a bolt of lightning" - John 7:27, flies in to Japan on 727 and has lightning strike the glass ceilinged dome of courthouse upon signature at official marriage ceremony. Claims "Yi" (Chinese God) was his father in law, Xi (Yoshimitsu Kanazawa) with great interest in space exploration says, "CCR" (Creedance Clearwater Revival). Being able to come into what may be the last confrontation of its type, as the U.S. and the Japanese completely assisting with everything they've got, the English signaling the same with what amounts to China first and the rest of Asia from there, is... as forceful of a presentation

AS could be made. Don't forget, not to slight Mr. Davanzo who looks like the photo of Emanuel from the bible, I've got scars on both feet, both hands and my backside as if I'd been pined to cross, stabbed in the back, escaped and the injuries healed. To Okinawa I also recommend bringing the sailor, Frenchman, who is or was the head of the U.N.'s Chernobyl cleanup. This being the immediate #1 complication of undamming the world's rivers, nuclear power plants. While the most of our team is in Okinawa I recommend having Mr. Davanzo at the Turkish National Library (those who don't ever forget) to make report of the successful negotiations as they come about. With the team thus assembled and in action we may realistically be able to sew up the idea a 20 year flexible plan to reengineer civilization, in 48 hours. We should be able to do it, no problem. It amounts to restoring natural flow to the world's rivers, having the dams be at the surfaces available for solar and precipitation collection at structures for work, living and transportation. And the replacement of the flush toilet with a urine separating, composting, no flush toilet, primarily manual fertilizer machine with front and rear water wash, blow dry, negative pressure ventilation... on this surface in order to have the dominant organism (people) be more principled and interesting so to make greater eventual opportunities. What

Should we as men tell the women? Working on the road construction traffic delay misery thing... (The dam reservoir tailrace no corduroy municipal water and sewer pipes are both leaking in the same ditch under the road, they had to dig the road up with the increase in sewerage from the shower jet massagers...) But look the new homes come with all kinds of fancy stuff in the bathroom... (A HIGH PRESSURE shower jet massager with no sewage in it) Yes, there's a filter on the water...
